# TIMELESS CLASSICS – REINTERPRETED

New design details and printing techniques open up new dimensions in interior design for the home and office. Bring colour, play of light and functionality into everyday life.

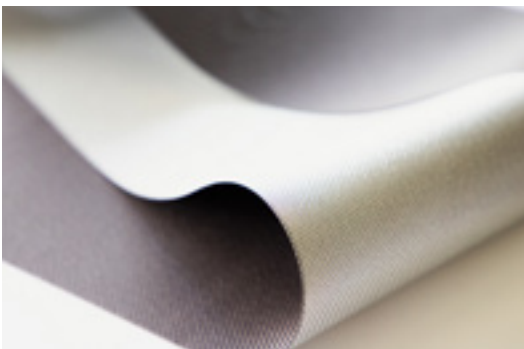

# MULTIFUNCTIONALITY

The vertical blinds from **Création Baumann** combine traditional elegance with modern functionality. Their soft feel and textile character create a timeless room solution. They offer a customisable interior shading system that enables precise light control and privacy through flexible turning and tilting. The large selection of fabrics, from transparent to dense, allows the ideal privacy screen to be selected individually and ensures optimum comfort in private and public spaces.

## Glare and heat protection as well as sound absorption

In addition to their stylish appearance, vertical blinds offer functional benefits such as glare and heat protection. They improve energy efficiency by reducing solar radiation in summer and preventing the room from heating up. Various metallised weaves produce blinds with different light transmission and reflection values. They also help to improve room acoustics. Our SPECTRA and LORDIN qualities achieve an alpha value of 0.50 when closed.

Glare and heat protection metallisation

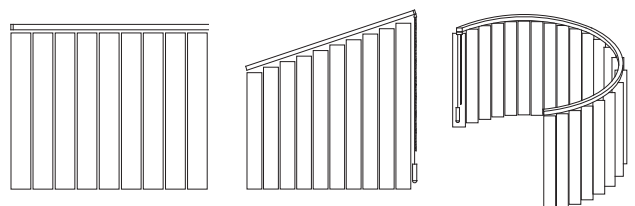

## Modern technology

The modernised weighting plate gives the blind a striking and architectural look. Vertical blinds now present themselves in a new dimension.

Flush and stylish – the new design of the weighting plate

Operation is manual via a cord or chain hoist or automated via a motorised door operation. Automated vertical blinds can be operated both via a classic wall-mounted control unit and via a radio control unit. The tried-and-tested track guide is now also available in black in addition to white and aluminium-coloured. The technology and tracks of the vertical blinds offer flexibility in terms of design to optimally support the planning of unique room concepts – on horizontal, rising or curved surfaces.

Modular technology

# VERSATILE RANGE

**Our range includes classic, timeless plain-coloured basics, functional and acoustic blinds as well as creative designs that are created in our design studio in Langenthal. Thanks to our production options such as transfer printing and laser technology, there are virtually no limits to the colours, structures and shapes.**

## **High-quality solutions**

A unique quality feature of our vertical blinds is that most of them are selvedge-woven, with firm selvedges that do not fray even after years of use. Most textile blinds are made of Trevira CS and therefore offer properties such as flame retardancy and dimensional stability.

RAYS, transfer print on IROLO

LASER LACE V on IROLO

**Our vertical blinds are the result of state-of-the-art technology and craftsmanship. Création Baumann attaches great importance to the highest quality «Made in Switzerland». This is why as many production steps as possible take place in our own factory in Langenthal.**

The textile blinds are assembled into finished systems on site, and transfer printing, laser designs and colouring of the blinds are also carried out in-house. This avoids long delivery routes and contributes to sustainability. The focus is on environmentally friendly materials and processes in order to fulfil our responsibility for a sustainable future.
